City Planning Division:

Seagate is construction an approximately 1200 square foot addition for construction of a larger freight elevator to support our production equipment. The freight elevator requires pier and grade beam foundations to support the 25,000 pound capacity, a supporting elevator equipment room, and sump room. It will be tied into the existing structure with access from inside the building as well as exterior access for the machine and sump room.

This addition on the south side of our Building J will result in the loss of seven parking spaces. We are proposing a proof of parking plan in order to demonstrate where we will add these parking spaces back onto the site should they be required. The proposed spaces will be on the south side of an existing basketball court and meet current code requirements for size and installation of an island with trees.

As the Seagate project manager for this addition, please reach out if you need any further details.

Regards,
